

Southeast Asia's Green Economy

Unlocking Systems for Growth and Impact

SEA-6 have yet to start bending the emissions curve, unlike China or the EU

GDP¹ and GHG emissions² (1990–2022, indexed to 1990)

APAC EU 27 + UK China SEA-6 1,800 1,500 1,200

Notes: (1) GDP expressed in year-2015 dollars in purchasing power parity terms; (2) GHG emissions include emissions from energy related sectors, including emissions from fuel combustion; these emissions do not include LULUCF emissions | Source: IEA

Three core and three enabling solutions to drive impact by 2030

Sustainable bioeconomy

Leveraging SEA's natural capital and assets for economic benefit and carbon reduction by promoting sustainable agriculture, expanding nature-based solutions and scaling biowaste utilization

Next-gen grid development

Invest in grid infrastructure to eliminate a critical bottleneck to scale renewable power generation, with long-term positive impacts on regional energy security and affordability

EV ecosystem

Accelerating 2W/4W EV production and adoption by implementing buyer incentives, triggering enabling infra development and developing regional EV supply chains

Climate & Transition Finance

Expanding access to capital for

decarbonization through innovative financing models, regional financing frameworks, strengthened policies and enhanced risksharing mechanisms

Carbon markets

Further establishing domestic & regional connected carbon markets, driving demand through stronger carbon policies, increasing supply of large-scale verifiable credit projects and strengthening enabling infra

Green Al

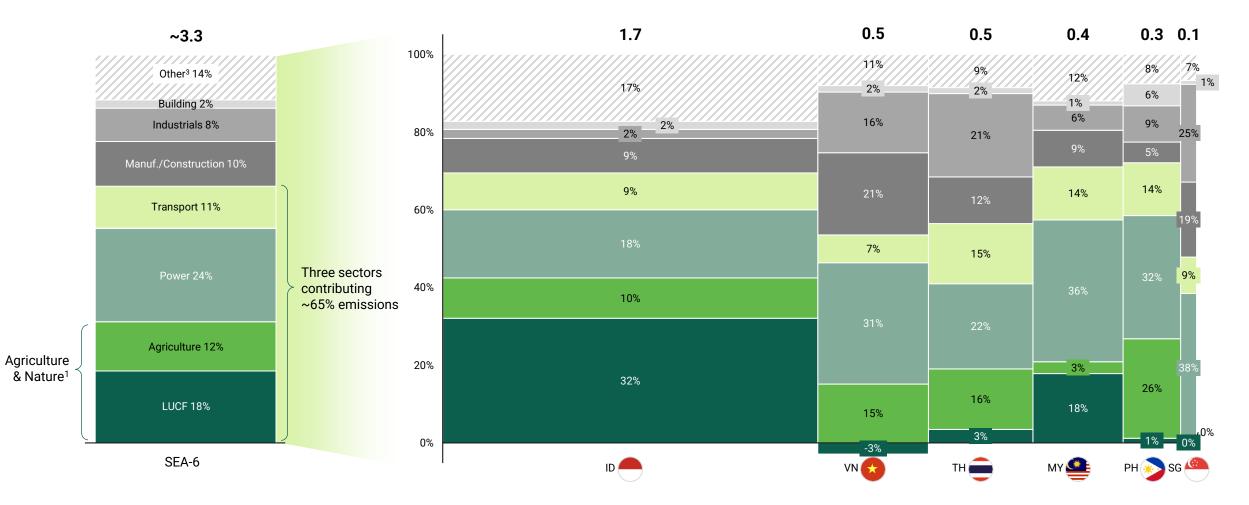

Advancing Al-driven sustainability

solutions while ensuring sustainabile DC growth through domestic & regional mechanisms (e.g., regional clean energy trading)

Energy is major part of the emission in SEA

SEA-6 GHG emissions by sectors (GtC02e, 2023)

Renewables are critical for long-term energy security in SEA

Fossil Fuel dependence Renewables are the path Next-gen Grid today will unlock a renewable future perpetuates vulnerability to energy security Annual cost to import 31% 50 6.7% fossil fuels (\$B) 28 GW \$140B T&D loss as a 41 percentage of total electricity generation in Installed Renewables capacity in SEA SEA-6 by 2030F (vs. ~4% in China, Japan, 31 and South Korea) 20% 30K+ GW 25 22 18 16 \$50B-\$60B 15 15 Renewable energy potential in 13 11 Southeast Asia 10 41% <1% Overall renewable potential is currently tapped CH MY PH TΗ VN ID Today Estimated by 2030 Electricity power T&D losses (TWh) 2024 2030F

BAIN & COMPANY () (Genzero Google Standard TEMASEK | ecosperity

A next-gen grid with cross-border connections would lower SEA's decarbonization costs and accelerate the green energy transition

Key initiatives include (non-exhaustive)

Grid planning

Plan for reliable, economical and green outcome with **longer term**

Grid upgrade

Upgrade existing asset for higher capacity though new technologies (e.g., superconducting)

Battery energy storage systems

Strategic use of largescale batteries to store excess RE and balance supply/demand

grid planning

X5 improvement in AC transmission capacity when using superconducting

Multi year

UK has taken 2+ years for

30%

improvement in RE penetration (reduction in RE curtailment rate) using battery systems Dynamic load balancing

Roof top

financing

Microgrids

Optimization of power flow in real time **using AI, sensors, and automation**, preventing overloads

20%-40%

improvement in RE utilization by adjusting power distribution to match output

Offering financing options for roof top solar could accelerate adaption

Installation of **small grids** that **operate independently** from the main grid, ensuring 24/7 power during blackouts and better RE integration

5-7 years

Payback for PH consumers once roof top solar is installed

18M

people with lack of electricity in SEA could be powered by renewablesbased microgrids Investable ideas | SEA offers diverse investment opportunities in grid development, gross profit margin of 10%–30%

	Overall grid transmission infrastructure		
	Grid expansion (e.g., power cables, towers)	Grid modernization (e.g., microgrids)	(e.g., BESS)
Market size¹ (\$ billion, 2030F)	\$4-\$6B	\$2-\$3B	\$0.3-\$0.5B
Indicative profit margins (gross profit)	10%-15%	20%-30%	20%-30%
Recent investments activity (M&A, JV, greenfield investments)	Japan's Hitachi Ltd. and Thailand's EGAT collab to limit transmission losses by developing voltage control systems in Thailand	TotalEnergies, BP, Shell, and Equinor committed \$500 million in regions including SEA to develop solar systems and microgrids ¹	Japan's Marubeni Corp. and Vietnam's VinES collab , where Japan is helping Vietnam develop battery energy storage solutions for better demand response and grid stabilization

Recommendations | Key steps to accelerate grid modernization and expansion

Policymakers and regulators (govt.)

- Robust planning and consistent communication
- Embrace new technologies (open for test)
- Faster approval process
- Collaboration with private sector

Power users

- Dual goal—sustainability and financial return
- Invest in energy efficiency gains
- Be creative—push for highimpact instrument like corporate PPAs to drive demand for energy

Financial institutions

- Practical approach assessing green financing opportunities—lower admin cost
- More collaboration across philosophy/MDBs/ sustainability funds
- Continue to push financing innovations (e.g. roof top, micro-grid)

- Drive new project cost down—better project planning, better sourcing strategy
- Push the authority with clear demand to accelerate process
- Embrace new technologies
